

Nigtica — Demo Video Script (≈2:30)

Format: screen recording + voiceover. Open the landing page full-screen, zoom 125% so text reads on video.

Scene 1 — Hook (0:00–0:20)

Visual: Landing hero, slow scroll down through the voice cards.

Say: Ask a popular voice assistant to read Yoruba out loud and you'll hear the problem — wrong accent, missing tones, words your mother wouldn't recognise. I built Nigtica so Nigerian languages get voices that sound like home.

Caption: Nigtica — hear your language, speak your mind.

Scene 2 — The voices (0:20–0:45)

Visual: Scroll the five voice cards; hover one.

Say: Five tongues: Yoruba, Igbo, Hausa, Pidgin, and English. Behind them, two engines — YarnGPT for our languages, Groq Whisper for English and foreign ones. The app routes every request to whichever speaks it best.

Scene 3 — Sign up (0:45–1:05)

Visual: Click Start speaking → signup page → check the Terms box → submit → land in the app.

Say: One account, thirty seconds. Notice the terms checkbox — you agree to use AI voices responsibly before you get in.

Scene 4 — Text to speech (1:05–1:45)

Visual: Click the Yoruba chip → text fills in → pick a voice → Speak → progress → hit play so the audience hears it.

Say: I tap Yoruba, the sample appears, I hit Speak. The app queues the job, polls for audio, and plays it back. Let me let it talk... Each voice comes from a live catalogue — nothing hardcoded.

Tip: Let the Yoruba audio play fully; it is the money moment.

Scene 5 — Speech to text (1:45–2:10)

Visual: Switch to Speech to Text tab → Start Listening → speak a short Yoruba or Pidgin greeting → Stop → transcript appears.

Say: Now the reverse — I speak, it writes. Pidgin and Yoruba go to YarnGPT; flip the engine to Groq for English. And see the note: AI can mishear names and tones, so verify anything important.

Scene 6 — Trust + close (2:10–2:30)

Visual: Scroll to history sidebar, hover the thumbs buttons; scroll footer; end on landing call to action.

Say: Every result can be rated, so quality per language is tracked, not guessed. Usage is metered, accounts can self-delete, and the whole site sits behind login. Nigtica — made with love by officialdili, for Nigerians. Link is in the description.

Recording notes

- Record the TTS audio through system audio (not the mic) so judges hear it clean.

- Do one full practice run first — live API calls cost credits and take seconds.
- Keep the demo account logged in to skip signup on retakes, or set DEMO_EMAIL and DEMO_PASSWORD for a one-click login.
